A Inherited energy
Descent loads elastic tissues
Sitting pause changes storage
Return during rise may decline
Measure loading history, support forces and tissue work.
B New preload
Muscle action before ascent
New elastic loading
Return can occur after a long pause
Recoil alone does not identify the source of stored energy.
C Chronic adaptation
Repeated varied floor transitions
Adaptation over weeks
Transfer to untrained function
Test against comparable activity; quantify strength, mobility and control.
Conceptual relationships; no participant data or effect estimates.
